NRC Docket No. 50-461

Subject: Licensee Event Report 2019-001-01

Enclosed is Licensee Event Report (LER) 2019-001-01: Main Feed Breaker Failed to Close During Bus Shift. This report is being submitted in accordance with the requirements of 10 CFR 50.73.

There are no regulatory commitments contained in this report.

Should you have any questions concerning this report, please contact Mr. Dale Shelton, Regulatory Assurance Manager, at (217) 937-2800.

Respectfully,

Thomas D. Chalmers
Site Vice President
Clinton Power Station

Estimated burden per response to comply with this mandatory collection request: 80 hours. Reported lessons learned are incorporated into the licensing process and fed back to industry. Send comments regarding burden estimate to the Information Services Branch (T-2 F43), U.S. Nuclear Regulatory Commission, Washington, DC 20555-0001, or by e-mail to infocollections.Resource@nrc.gov, and to the Desk Officer, Office of Information and Regulatory Affairs, NEDB-10202, (3150-0104), Office of Management and Budget, Washington, DC 20503. If a means used to impose an information collection does not display a currently valid OMB control number, the NRC may not conduct or sponsor, and a person is not required to respond to, the information collection.

Abstract (Limit to 1400 spaces, i.e., approximately 14 single-spaced typewritten lines)

On May 22, 2019, at 0925 CDT, at approximately 98.4% power while attempting to transfer 4160V bus 1A1 to the Reserve Auxiliary Transformer (RAT) (main) from the Emergency Reserve Auxiliary Transformer (ERAT) (reserve), RAT 4160V bus 1A1 main feed breaker 1AP07EK failed to close and immediately indicated tripped. A walkdown of feed breaker 1AP07EK showed no abnormal indications or relay flags. Feed breaker 1AP07EK was replaced and tested satisfactory. Initial troubleshooting identified that the latch check switch breaker closure permissive was not made up. As this permissive makes up following breaker closure it has been determined that feed breaker 1AP07EK was inoperable since April 17, 2019. The cause of the breaker failure was determined to be establishment of a breaker preventive maintenance strategy which was beyond the capability of the Molykote BR-2 lubricant used in the breaker. Changes to DHP Breaker preventive maintenance frequencies will be implemented to ensure that lubrication periodicities support the effective life of the lubricant. In addition, DHP Breaker maintenance and refurbishment procedures will be revised to incorporate use of Molykote G-4700 grease in place of Molykote BR-2. This event is reportable in accordance with 10 CFR 50.73(a)(2)(i)(B) as, "any operation or condition which was prohibited by the plant's Technical Specifications."

EVENT IDENTIFICATION

Main Feed Breaker Failed to Close During Bus Shift

A. Plant Operating Conditions Before the Event

Unit: 1

Event Date: May 22, 2019

Event Time: 0925

Mode: 1

Mode Name: Power Operation

Reactor Power: 098

B. Description of Event

On May 22, 2019, at 0925 CDT, at approximately 98.4% power while attempting to transfer 4160V bus 1A1 [BU] to the Reserve Auxiliary Transformer (RAT) (main) [XFMR] from the Emergency Reserve Auxiliary Transformer (ERAT) (reserve) [XFMR] in accordance with procedure CPS 3501.01, "High Voltage Auxiliary Power System," Section 8.1.8, RAT 4160V bus 1A1 main feed breaker 1AP07EK [BKR] failed to close and immediately indicated tripped. Annunciator 5060-1B [ANN] for auto trip of breaker was received. The operator placed the synchronizing switch in OFF prior to releasing the hand switch to the AUTO position in accordance with CPS 3501.01, Section 8.1.8.5, to prevent auto trip of the load breaker and the resulting loss of the bus.

A walkdown of feed breaker 1AP07EK showed no abnormal indications or dropped relay flags. The 4160V bus 1B1 [BU] was being supplied by the RAT with the Static Var Compensator (SVC) in service and showed no abnormal indications. The 4160V bus 1C1 [BU] was being supplied by the ERAT with the SVC in service and showed no abnormal indications. Feed breaker 1AP07EK was last closed on April 17, 2019, during performance of procedure CPS 9080.01, "Diesel Generator 1A Operability - Manual and Quick Start Operability Surveillance." Initial troubleshooting identified that the latch check switch breaker closure permissive was not made up. As this permissive makes up following breaker closure it has been determined that feed breaker 1AP07EK had not been operable since its last closure on April 17, 2019.

**LICENSEE EVENT REPORT (LER)
CONTINUATION SHEET**

(See NUREG-1022, R 3 for instruction and guidance for completing this form
<http://www.nrc.gov/reading-mv/doc-collections/nuregs/staff/sr1022/r3/>)

Estimated burden per response to comply with this mandatory collection request: 80 hours. Reported lessons learned are incorporated into the licensing process and fed back to industry. Send comments regarding burden estimate to the Information Services Branch (T-2 F43), U.S. Nuclear Regulatory Commission, Washington, DC 20555-0001, or by e-mail to Infocollects.Resource@nrc.gov, and to the Desk Officer, Office of Information and Regulatory Affairs, NEOF-10202, (3150-0104), Office of Management and Budget, Washington, DC 20503. 2019	- 001	- 01

NARRATIVE**C. Cause of the Event**

The Preventive Maintenance strategy for DHP breakers at CPS consists of an eight-year breaker preparation and swap activity and a twenty-year vendor refurbishment activity. These frequencies take into consideration performance history, manufacturer recommendations, and Performance Centered Maintenance (PCM) guidance. The eight-year preparation and swap activity was based on the mild operating environment, three to ten year guidance in the PCM Template Bases, and a manufacturer recommendation of once per 2000 cycles. The failure analysis conducted by Westinghouse for the breaker identified that lubrication throughout the breaker was found to be dry or tacky. Therefore, the cause of the feed breaker 1AP07EK failure to close was determined to be establishment of a breaker preventive maintenance strategy which was beyond the capability of the Molykote BR-2 lubricant used in the breaker.

D. Safety Consequences

There were no safety consequences associated with the event described in this report as the affected bus remained energized from the reserve feed (ERAT). If the ERAT had become inoperable the DGs were available to start and provide power to the bus. Because Limiting Condition for Operation (LCO) 3.8.1, "ELECTRICAL POWER SYSTEMS – AC Sources – Operating," Condition A, was not entered from April 7, 2019 until the condition was discovered on May 22, 2019, this event is reportable in accordance with 10 CFR 50.73(a)(2)(i)(B) as, "any operation or condition which was prohibited by the plant's Technical Specifications."

E. Corrective Actions

- (1) Feed breaker 1AP07EK was replaced and tested satisfactory.
- (2) Changes to DHP Breaker preventive maintenance frequencies will be implemented to ensure that lubrication periodicities support the effective life of the lubricant.
- (3) DHP Breaker maintenance and refurbishment procedures will be revised to incorporate use of Molykote G-4700 grease in place of Molykote BR-2.

F. Previous Similar Occurrences

There were no previous events identified involving a breaker failure similar to the occurrence described in this licensee event report.
